

ScanWorks is a cloud based patient resource database that facilitates the viewing, interpretation, and collaboration of various medical data and images across multiple virtual environments.

This simple web interface allows medical professionals to quickly navigate to a particular patient's data through a secure connection.

Ideally suited for institutions and organizations looking for a scalable solution that can be utilized in urban and rural areas, this robust platform presents an affordable, alternate solution.

Multiple image sets that can be viewed simultaneously on the screen. The interface allows medical professionals to view various modalities and further append notes and comments to specific images. Notifications through alerts give an institution the ability to effectively tackle issues and facilitate a timely strategy. This platform can be customized to adapt to the requirements of various institutions. With a significantly low maintenance overhead, this platform presents an attractive solution to the ever increasing demands of accessing patient data through a web portal.

### Key Features:

- Securely read patient information from hospital, government, and insurance database sources
- Work with data off-line. Subsequent synchronization of data between the database source and device is available
- Modify and upload the updated information back to the source databases
- Encryption of data on the device and during transmission is provided
- Doctor notification services are available via SMS, Email, and mobile apps.
- Convert and read data from multiple, otherwise incompatible sources.
